HORN MEASUREMENTS AND WEIGHTS OF THE GREAT GAME OF THE WORLD:

BEING
A RECORD FOR THE USE OF SPORTSMEN AND NATURALISTS.

BY
ROWLAND WARD, F.Z.S.,
Author of "The Sportsman's Handbook," &c.

OVIBOS MOSCHATUS.

London:
AT "THE JUNGLE," 166, PICCADILLY.
AND OF ALL BOOKSELLERS.

1892.

THIS BOOK IS DEDICATED
TO THE
SPORTSMEN OF THE WORLD,
WITHOUT WHOSE DETERMINED PLUCK AND LOVE OF TRAVEL IT COULD
NOT HAVE BEEN PRODUCED, NOR COULD I HAVE SPENT
A LIFE-TIME IN THE ART WHICH I HAVE
TRIED TO ADVANCE.

ROWLAND WARD.

PREFACE.

MY object in producing this book is to start a record of Horn Measurements of the Great Game of the World. I only regret that I did not commence it at an earlier date, as it would then have been more complete. But in my earlier life I had but little help, and often worked thirty hours at a stretch; my work necessitated attention to specimens that demanded immediate treatment, and my love for reproducing life-like studies prevented me from keeping records.

The measurements presented here have been taken recently by one hand and, for that reason, I value them the more. The dimensions from acknowledged authorities I am not responsible for. This book is not designed to be in any way a scientific work, but it is prepared for gentlemen sportsmen and scientific men who are interested to see comparable measurements at a glance. I think these have not been produced in like form before. Of course, the record can be added to, and I shall feel indebted to sportsmen who will contribute measurements, for I am not

producing this work in a completed form—it must grow. It is to be borne in mind that many trophies which have passed through my hands are now scattered all over the world, and the dimensions of them, for the time, are not recorded here. Some that I give now are fine measurements, some are only ordinary statistics, many are of new species altogether; these last being mainly a result of the quite recent opening up of Africa. The advice noted as to the way to measure must be dealt with strictly, for many persons measuring by different methods produce untrustworthy record. We have tried to be fair in producing the statistics, taking them rather under than over the mark; and the tape has not been pressed into corrugations, but carried outside, over all inequalities.

Many gentlemen's trophies I should like to have measured, but those specimens have either changed hands or are now in some remote part of the world, and the book cannot be delayed longer; but distance has not prevented me from obtaining many important statistics.

R. W.

ABBREVIATIONS AND SIGNS.

♂ Male. ♀ Female. Unrecorded.

LENGTH is expressed in inches, where not otherwise noted.

MEASUREMENTS are on the outside of horn from tip to base. Circumference is at the base; with Deer above first tine.

MEMO.—Horns that possess a core have a tendency to shrink.

WEIGHTS taken on the field should be accepted as approximate.

P.Z.S., Proceedings of the Zoological Society.

SWINHOE'S DEER (*Cervus swinhoii*).

[Mr. SWINHOE on "Chinese Mammals," P.Z.S. 1870, p. 646.]

["*Cervus (Rusa) Swinhoii*," SCLATER, P.Z.S. 1862, p. 152; SWINHOE, P.Z.S. 1862, p. 364.]

IN the central ranges of Formosa, near Mount Morrison, this brown deer is very common; and on a visit I paid to the wild tribes of these parts in February 1866, I found them hunting the deer with dogs.

A place is cleared in the forest, where a party of men hide armed with matchlocks; the dogs yelp after the deer and drive them into the open, where the hidden sportsmen get easy shots at them. The son of the chief with whom I was staying had just returned from a successful battue with the robust antlers and flesh of a large buck. I induced him to return for the head, which he had thrown away on the field. I was thus enabled to secure a fine skull for the British Museum.

The young of this species, about half-grown, is reddish brown, with the tail bushy and black, but reddish at its root; sides of the body paler, and the belly blackish brown; legs pale towards the hoofs, the latter black; under surface of tail, abdomen, and inner sides of hind legs down to middle of shank yellowish white, the breast and belly being blackish brown; under surface of head and neck mottled whitey brown; crown of the head, with many of the hairs, tipped with black; from the occiput a dark line runs down to the base of the tail; ears blackish brown, tipped and margined with ochreous white, and whitish on their insides.

The adult, in summer, has its coarse hair deep brown, faintly mottled, rufous on the rump; between the fore legs and the thighs ochreous white; tail bushy and dark. In winter it becomes a deeper brown.

The Society's Gardens have had two or three examples of this animal alive; and Dr. Sclater is doing it justice in his paper for the "Transactions." Fig. 5 represents the antlers of a mature individual which I procured in South Formosa.

I have not heard of any species of *Rusa* occurring on the main of China; but in Hainan the *C. hippelaphus* appears to abound. From North China we have the *Cervus xanthopygus* (A. M. Edwards), the *Elaphurus davidianus* (A. M. Edwards), and the *Capreolus pyaargus* (Pall).

THE PHILIPPINE DEER (*Cervus philippinus*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1877, p. 51.]

ADULT MALE.—Hair of moderate length and rather harsh. General colour, rich ruddy brown, darkest on the back and lightest on the neck. Forehead and cheeks rufous fawn-colour; dark (almost black) streaks commence over each eye, and, blending together, form a band running down the centre of the face, which is separated from the dark moustache-like mark bordering the muzzle by a narrow track of pale fawn-colour. Breast and belly uniform brown. Tarsal gland plainly marked by a rufous spot. Ears of moderate size, covered externally by short close-set hair. Horns remarkably rough and massive; a powerful, long brow-antler, and one short tine directed inwards. Height at shoulder, about 27 inches.

The skull of this species is an exact miniature of that of *Cervus aristotelis*.

FEMALE.—In external colouration differs in no way from the male.

YOUNG.—Of a uniform brown, without spots.

HABITAT.—Island of Luzon, Philippines.

The Philippine deer is a very stout-built, short-limbed, powerful animal, in carriage and general appearance closely resembling the common Sambur (*Cervus aristotelis*).

KUHLS STAG (*Cervus kuhli*).

[Sir VICTOR BROOKE, P.Z.S. 1878, p. 902.]

[1839-44. *Cervus kuhli*, Mull. "Verh. Nat. Gesch. Ned. Bez. Zoo.," p. 223, pls. 44, 45, figs. 12-14.]*Habitat*—Bavian Islands. *Type*—Mus. Leyden.

THIS species was originally described by Muller from specimens collected by Diard in the Bavian Islands, to which locality the species, as far as is at present known, is confined. The auditory bullæ in *Cervus kuhli* are largely inflated. By this character the skull may be distinguished from that of any of the Rusine deer, with the exception of *C. porcinus*. The skull of *C. kuhli* differs from that of *C. porcinus* in having the facial portion anterior to the orbits much more compressed, and the orbits much more prominent. *C. kuhli* has proportionally much longer limbs than *C. porcinus*; and all the hairs of the back and sides are annulated

in the former and not in the latter species. The young of *C. kuhli* are unspotted, which is not the case with those of *C. porcinus*. Both species are devoid of upper canines.

SCHOMBURGK'S DEER (*Cervus schomburgki*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1876, p. 306.]

ADULT MALE.—Antlers with very long powerful brow-antlers, which are frequently forked; beam very short, and more or less laterally compressed; upper part of the antlers strictly dichotomous, each of the main branches about equally developed, and in itself dichotomous, and furnished with long cylindrical tines. External surface of the antlers smooth and polished. Hair in winter rather long and coarse. General colour uniform brown, darkest on the nose and upper surface of the tail, and lightest on the cheeks and lower parts of the sides and haunches. Lower lip, belly, and under surface of tail whitish. Upper lip, occiput, and limbs with a decided tinge of rufous. The hair on the front of the metacarpal cannon bones is lengthened into an everted mane about 2 inches in length.

IMMATURE MALE.—Antlers with the posterior of the two main branches less developed than the anterior branch.

Habitat—Northern parts of Siam.

PERE DAVID'S DEER (*Cervus davidianus*).

[Sir VICTOR BROOKE, P.Z.S. 1878, p. 906.]

ANTLERS dichotomous, about twice the length of the head, pedestals short. The anterior branch of the antlers (*b*) more strongly developed than the posterior branch (*c*) and in adult specimens bifurcating and carrying many strong tines. Facial portion of the skull much elongated. Ears small and narrow; eye small; tail long; neck maned; stature large; young unspotted.

Distribution—North-eastern Palæarctic region.

MANTCHURIAN DEER (*Cervus mantchuricus*).

[SWINHOE, P.Z.S. 1865, p. 1.]

FINE buck from Newchwang, still in summer coat, examined 30th September, 1864. General colour reddish brown; under neck and fore thighs covered with rather long dusky brown hair; hair of neck, chiefly on its back part and down part of the back list, long and shaggy; list black between the shoulders, fading towards

the tail, inner portion of hind thighs, and inside hair of ears; a large spot on the outer portion of ear near its root; rim round the eye and chin; throat white; body ornamented with large spots of white; tail, including apical hair, nearly one foot long; the hair that overhangs the roots of the tail on either side black; basal half of tail white; apical half black with white tips; under the tail and between the hams white; knees and front of tibiae brown; head, from crown to tip of nose, about 20 inches long; ear about 9 inches; forehead and before the eyes reddish; rest of face brownish fawn colour; horns, with frontal tine about 5 inches long, bent a little downwards at the tips; about 8 inches of the stem between lowest tine and the next above, which are broken and represented only by a knob; top stem between that and the top knob about 4 inches.

Habitat—China.

PERUVIAN ROE DEER (*Cariacus (furfifer) antisimensis*).

[Dr. J. E. GRAY, F.R.S., P.Z.S. 1869, p. 498.]

THE horns divide from the base into two branches; the front one is erect, conical, and acute, with a short conical branch on the outer side, and in the middle one or two more or less elongate, basal anterior or interior snags. The hinder part of the base and sheath compressed, diverging horizontally into a strong, angular, tapering branch, which is nearly as long as the erect one, with several irregularly placed, more or less elongate, acute processes; the upper part, near the roots, with one or two cylindrical diverging branches on its upper and lower sides. Like the small branches on the erect part of the horn, they are not exactly similar on the two horns.

The metatarsus is without any glandular tuft on the outside. On the inner side of the hock is a large rounded tuft of such hairs. The fur consists of thick, elastic, tubular quills. The skull has a well-marked, deep, triangular pit in the front of the orbit. The female is without horns. This animal may be called *Xenelaphus huamel*.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
9 $\frac{1}{2}$	7 $\frac{5}{8}$	4 $\frac{5}{8}$	Tinta, South Peru	H. Whitely, British Museum.
9 $\frac{3}{8}$	2 $\frac{1}{2}$	8 $\frac{1}{8}$	Ceuchepate, Peru (11,000 ft.)	Do.

MULE DEER (*Cariacus macrotis*).

THIS variety has much larger ears than the White-tailed or Black-tailed Deer, and owing to its having the tip of the tail black, is often called Black-tail.

Habitat—Includes Oregon, Nebraska, Dakota, West of Missouri, Colorado, and Kansas.

10¾	7¼	3	Africa ...	Earl of Derby, British Museum.

JACKSON'S HARTEBEESTE (*Bubalis jacksoni*).

Habitat—Central Africa: Country between Lake Victoria Nyanza and Lake Naivashœ.

THIS is a new species of Hartebeeste recently shot by Mr. F. J. Jackson in British East African Territory, who in his letter to me, dated October 1890, says: "I do not think it is likely to extend further south, but of course it may extend to the Cape for what we know; if it is *A. caama* it may do so, but I am inclined to doubt its being the same as the S. African animal. I seem to have an idea that the one at the British Museum is very much darker, and the horns different, but this is only from memory, and I cannot be sure. Up north all along the top of the Elgeyo Escarpment (continuation of Mau) into Turquel, to the north and north-east of Mount Elgon, it is common, and takes the place of *A. cokei*. Round Baringo it is fairly plentiful, but some marches south of Njemis the *A. cokei* takes its place."

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
20½	11¾	9½	East Africa . . .	F. J. Jackson.
23½	12	9	E. Gedge.

TORA ANTELOPE (*Bubalis tora*).

Habitat—North Africa. Numerous in Soudan and Abyssinia.

* Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
19 $\frac{3}{4}$	9	16 $\frac{1}{2}$	Abyssinia... ..	British Museum.
19 $\frac{1}{4}$	9	13 $\frac{3}{4}$	Do.	Sir Victor Brooke's Collection.

3	$1\frac{5}{8}$	$2\frac{3}{4}$	River Gambia ...	Charles B. Mosse, British Museum.

NANOTRAGUS NIGRICAUDATUS.

[Sir VICTOR BROOKE, P.Z.S. 1872, p. 875.]

GRIZZLY fawn; forehead rufous; tail black, of moderate length; temporal gland distinct, black; knee-brushes large; false hoofs present but small; ears moderate; horns slender, moderate in length, and slightly bent forward.

Height at shoulder, 20 in.; length of ears, $4\frac{1}{2}$ in.; length of horns, 3 in. A narrow mark about one inch in length on each side of the naked muzzle; a line passing round the eye and suborbital pit, but not meeting in front of the gland, lower lip, chin, spot on throat, belly, inside of limbs nearly as far down as the carpal and tarsal joints, and rump white. Nose and ears externally dusky brown; forehead and occiput rufous; temporal gland large, round, and covered with very short bluish-black hair, that covering the region between the suborbital pit and the eye being of similar character and colour; neck, back, flanks, and sides of a peculiar grizzly fawn colour. This peculiarity is obtained by the base of each hair being almost white, the tip rufous, the intervening part of a deep bluish grey.

ABYSSINIAN ORIBI (*Nanotragus montanus*).*Habitat*—Abyssinia.

[Sir VICTOR BROOKE, P.Z.S. 1872, p. 875.]

SANDY fawn; tail of the same colour as the back, and very short, almost rudimentary; temporal gland and knee-brushes distinct; false hoofs small; ears moderate; horns short and subconical.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
$4\frac{3}{4}$	$1\frac{3}{4}$	$2\frac{1}{2}$	Dembelas, Abyssinia.	British Museum.

SINGSING ANTELOPE (*Cobus defassus*).*Habitat*—Africa.

[Dr. SCLATER on Capt. Speke's trophies, P.Z.S. 1864, p. 102.]

THE general aspect of the head resembles *Kobus ellipsiprymnus*, but the face is blacker, and the top of the head between the horns dark rufous. "It does not possess the lunate mark on the rump of the Waterbuck, and does not stand so high, but is rather more stoutly built." (Note by Capt. Speke on above.)

[Dr. JAMES MURIE, P.Z.S. 1867, p. 5.]

	Baron Hernier.	British Museum.	Capt. Speke's specimen.

GRANT'S GAZELLE (*Gazella granti*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1878, p. 723.]

GENERAL colour, very rich fawn tinged with purple, the neck and back in certain lights mottled like watered silk; this pattern is gained by indefinitely bounded bands of darker hair. Central facial band darker than the neck and body and strongly tinged with rufous on the forehead; a large black patch above the nostrils; large facial streaks very definite, white; dark facial streak black, extending from the base of the horn to the eye, which it almost encircles, and from the eye to above the corners of the mouth; posterior to the eye is a small white patch; external surface of the ear-conchs streaked with dark brown; dark lateral and pygal bands distinctly marked, the former grizzled, the latter very broad and jet-black; lower two thirds of the tail black, the upper third white; the tip of the tail is tufted; for the remainder of its length, it is furnished with coarse hairs which project at right angles to its axis; chin, lower surface of the head, breast, belly, inside of limbs, and

rump white; the white of the rump extending forwards in an angle into the darker colour of the body; knee-brushes of moderate length, grizzled; horns of great length in both sexes, much compressed from side to side, marked by strong annulations which completely surround the horn for the proximal half of its length, but become obsolete on the posterior surface of its distal or upper half. The horns diverge at first gradually, then more boldly, their tips converging and giving to the set of the horns a remarkably perfect lyrate form.

Comparison with allied Species.

Gazella granti belongs, as pointed out in my former description, to the group of long-limbed large Gazelles which are distinguished by the white of the rump projecting in an angle into the fawn-colour of the back and sides (*vide* P.Z.S. 1873, p. 537, B.). The allied species are *G. søemmerringi*, *mohr*, and *dama*. From all these it differs in the very much greater size, and in the form of the horns. It is also peculiar in the presence of the dark lateral band, which is wanting in the three above-named species, and in the remarkably definite black pygal band, which is only shown in very young specimens of *G. søemmerringi*, is absent entirely in *G. dama*, and only indefinitely shown in *G. mohr*. In the watered-silk mottling of the neck and back *Gazella granti* differs from all other known Gazelles.

SÆMMERRING'S GAZELLE (*Gazella sœmmerringi*).

(*Somali name*—"Awal.")

[Sir VICTOR BROOKE, Bart., P.Z.S., 1873, p. 549.]

HAIR smooth and short. Facial band blackish, slightly rufous between the horns; light facial streak white, well marked; dark facial streak blackish, very definite, running through the eye and leaving its upper end as a black spot isolated above it. A spot below the eye, chin, throat, and a spot in front of the neck white; lateral bands wanting; breast, belly, tail, and rump white, the white of the latter encroaching into the sandy fawn-colour of the rest of the body and the haunches. Knee-brushes well developed. Ears long, bordered externally with black. Horns in the male lyrate, massive, and strongly annulated, well developed but less massive in the female. Height about 30 in.

Habitat—Abyssinian coast of the Red Sea, Danakil and Somali countries, Berber, and East Senaar (Henglin).

MOHR (*Gazella mohr*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 548.]

HAIR close-set and smooth; central facial band grizzled rufous above, fading away below into the dirty white of the lower parts of the face and cheeks; dark facial streak thin, but definite, black; spot on the throat, breast, belly, anterior of hind legs and posterior of fore legs, rump, and tail (with the exception of the black tip) white; the white of the rump projects forwards into the deep rufous fawn-colour of the neck, back, sides, and haunches; this colour, which is darkest on the neck, runs down the front of the fore and outside of the hind extremities; lateral bands wanting; pygal band blackish rufous, very thin and short; ears moderate; horns in both sexes; in the male very massive and rather short, strongly annulated, the points projecting suddenly and boldly forwards; knee-brushes long; height about 34 in.

The Mohr or Mhore, is 4 ft. 2 in. long from the nose to the origin of the tail, 2 ft. 6 in. high at the shoulder, and 2 ft. 8 in. at the croup; the length of the head from the nose to the root of the horn is 7 in.; that of the horn $9\frac{1}{2}$ in. on the curve, and $7\frac{1}{2}$ in. in a straight line; and that of the tail 7 in. without the terminal tuft.

Habitat—Senegal.

SOMALI PLATEAU GAZELLE (*Gazella pelzelni*).

THIS is common round Berbera, but is replaced by *Gazella spekei* when the Somali plateau is reached. It has often been mistaken for *Gazella spekei*, but can readily be distinguished from that species by its straighter horns and the absence of the loose skin on the nose.

Habitat—North-East Africa, Somali.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.

ARABIAN GAZELLE (*Gazella arabica*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 544.]

HAIR very short and smooth; central facial band rich bay above, darker below, forming a nose-spot; light facial streak very strongly marked, running from the base of the horn over the eye, stopping just below the nose-spot; dark facial streak distinct, blackish; breast and belly white; dark lateral and pygal bands grizzly brown; light lateral band grizzly fawn; upper parts of the sides and back rich grizzled bay in adult specimens, the younger animals being greyer; knee-brushes well developed, blackish; tail black; horns massive, the annulations wide apart, diverging gradually from two-thirds their length, the upper third diverging more decidedly, and leaning a little forwards; ears moderate; size about equal to that of *Gazella dorcas*.

Habitat—South Arabia.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
8½	4	2	Mosha, South Arabia.	W. T. Blandford, British Museum.
4¾	3½	3¾	Sir Victor Brooke's Collection.

DORCAS GAZELLE (*Gazella Dorcas*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 538.]

HAIR rather long and coarse; central facial band rufous above, inclining to fawn-colour towards the nostrils; a dark nose-spot sometimes present, not depending on age or sex; light facial streak distinct, encircling the eye; dark facial streak definite, brownish rufous; upper and under lip, breast, and belly white; dark lateral and pygal bands very definite, rufous brown; light lateral band distinguishable from the rich fawn-colour of the upper parts of the back by

its more silvery hue; knee-brushes well developed, in colour variable; tail black, long, and tapering; horns long and annulated, rather slender, with their points bent inwards and forwards; ears about $5\frac{1}{2}$ in.; height at shoulder barely 24 in.

Habitat—Syria, North Arabia, Egypt, Algeria, Morocco, and Senegal.

ISABELLA GAZELLE (*Gazella isabella*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 539.]

HAIR very short and soft; central facial band sandy-rufous; nose-spot absent; light facial streak present but indefinite, running into the dark facial streak, which is in some specimens but faintly marked; dark lateral band almost obsolete; light lateral band of a delicate pale fawn-colour, distinctly visible against the isabelline sandy fawn-colour of the back and haunches; tail variable, but generally rufous for a large part of its length, the tip blackish; horns short, massive, and strongly ringed, the tips bent suddenly forwards and inwards; ears very long; height less than that of the last species (barely 24 in. at shoulder).

Habitat—Kordofan, Senaar.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.

GAZELLA DAMA.

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 547.]

HAIR short and smooth; facial and lateral markings wanting; neck, and upper part of the neck, sandy-red; face, spot on the throat, and the rest of the body and limbs white; knee-brushes well developed; ears moderate; horns lyrate, strongly annulated, well developed in both sexes.

Habitat—Desert of Korti (Rupp.), Southern Nubia, and Kordofan (Heugl.).

GAZELLA DAMA—*continued.*

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
11 $\frac{3}{4}$	6	3 $\frac{3}{4}$	Wednoon, Mogador.	W. Willshire, British Museum.
10 $\frac{1}{2}$	4 $\frac{5}{8}$	6 $\frac{3}{8}$	Senegal	Sir Victor Brooke's Collection.

GAZELLA RUFIFRONS.

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 540.]

CENTRAL facial streak uniform sandy-yellow; light facial streak indefinite; dark facial hardly distinguishable from the colour of the cheeks, which are sandy-yellow; dark lateral band distinctly marked, brown; light lateral band plainly shown between the dark streak and the yellowish fawn-colour of the back and haunches; pygal-band indistinct; no knee-brushes; height, a little over 2 feet.

Habitat—Senegal.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
6 $\frac{1}{8}$	2 $\frac{1}{4}$	2 $\frac{7}{8}$	Bogos Country, Abyssinia.	British Museum.

ADDRA GAZELLE (*Gazella ruficollis*).

IT is about 5 ft. 4 in. long, and 3 ft. at shoulders; the head is 8 in. long, and tail about 9 in.

Habitat—North Africa.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
12 $\frac{1}{4}$	4	5 $\frac{5}{8}$	Senaar	British Museum.
11 $\frac{7}{8}$	5 $\frac{5}{8}$	$\frac{5}{8}$	Kordofan	Do.

PERSIAN and YARKUND GAZELLE (*Gazella subgutturosa*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 545.]

HAIR in winter rough and coarse; in summer, much softer and smoother. During both seasons the dirty-white of the face and cheeks is only relieved by the dark facial streak, which is short and narrow, but defined by a sprinkling of rufous hairs; the lateral and pygal bands are very faintly indicated, the dark bands being more rufous, the light band rather paler than the grey fawn-colour of the upper parts of the body; breast and belly white; tail and ears moderate in length, the former blackish-rufous; horns absent in the female; in the male long, annulated, and lyrate, the points projecting inwards; height, about 26 in.

Habitat—High plateau of Persia, Northern Beloochistan, Afghanistan.

6 $\frac{1}{8}$	3 $\frac{7}{8}$	2	Do.
5 $\frac{3}{4}$	3 $\frac{3}{8}$	$\frac{5}{8}$	Do.

GUTTUROSA ANTELOPE (*Gazella gutturosa*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 546.]

HAIR in winter long and coarse; anterior part of the face slightly darker than the pale grizzled fawn-colour of the sides of the face, neck, back, sides, and haunches; facial and lateral markings wanting; belly and anal disc, which surrounds the very short tail (the root of which is white, the tip fawn-colour), dirty white.

In summer all the parts which are grizzled fawn in winter are of an "intense isabel yellow" (vid. Radde); ears very short; horns short, weakly annulated, the curves as in the last species (*G. Subgutturosa*), but much less boldly shown; height about 30 in.

Skull: anteorbital fossa very shallow; nasals converge to a point and are rather elongated.

Habitat—Mongolia.

SPRINGBUCK (*Gazella euchore*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 550.]

HAIR rather long but smooth; the central facial band has the upper part distinctly marked, but ends in a point between the eyes, rufous; the light facial streaks meet below the eyes, white; dark facial streak thin from above, downwards, but very definite, deep rufous; cheeks, line in front of the neck, breast, belly, inside of limbs, dorsal mane, starting from the anterior lumbar region, and tail (with the exception of the long black terminal hairs) white; dark lateral and pygal bands deep rufous, the former very broad and well defined; light lateral band very faintly shown, being of a less rufous tint than the fawn-colour of the shoulders, upper parts of the back, and haunches; ears long; horns in both sexes, but very small in the female; in the male they are truly lyrate, strongly annulated, and massive, of moderate length; knee-brushes absent; height at shoulder about 30 in.

Skull: nasal bones rather elongated and pointed; dentition, i. $\frac{0}{3}$, c. $\frac{0}{1}$, p. $\frac{2}{2}$, m. $\frac{3}{3}$; the first premolar in the upper jaw is almost rudimentary, its opposing tooth in the lower jaw is wanting; in the milk-dentition, however, the first of the three lower molars is represented by an exceedingly small cylindrical tooth.

Habitat—South and West Africa. This species does not appear to occur in the Zulu country.

ATLAS GAZELLE (*Gazella cuvieri*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 542.]

HAIR long and rather coarse; central facial band grizzled rufous brown above, darker below, sometimes forming a distinct nose-spot; light facial streak present, but indefinite; dark facial streak blackish brown, running into and blending with the grizzled rufous brown of the upper parts of the body; knee-brushes long, blackish; tail black; horns strongly annulated, massive and long, diverging gradually from about two-thirds their length, the upper third leaning more decidedly outwards and a little forward; hars very long.

Adult male: height, $27\frac{1}{2}$ in.; length of horns, 12 in.; length of ears, $7\frac{1}{4}$ in.

The above description must be taken as applying to an average specimen, very great variety being exhibited by this large and well-marked species; in fact, out of a large series, including living specimens, I have never seen two for which the same description would suffice. The species, however, is easily known from all the other small gazelles by its larger size, rough coat, dark colour, and unusually long ears. As I have said above, I think the larger gazelle seen by Tristram in Algeria was probably of this species. A skull in my possession is very nearly as large as that of *Gazella sæmmerringii*.

BLACK-TAILED GAZELLE (*Gazella tilonura*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1873, p. 542; Antilope melanura (HENGL., ANT, und BÜFF), p. 6; 1869, Antilope tilonura (HENGL., REIS, WEISS, NIL.), p. 315.]

CENTRAL facial band rufous fawn; light facial streak indistinct, encircling the eye; dark facial streak very indistinct, almost indis-

tinguishable; neck, back, uppersides, flanks, haunches, shoulders, root of the tail, anterior of fore legs, knee-brushes, and outer sides of the hind legs sandy fawn-colour; dark lateral band distinct, blackish, very narrow from above downwards; light lateral very indefinite; breast and belly white; horns lyrate and strongly annulated.

Height, 29 in.; length of ears, $5\frac{1}{4}$ in.; length of tail, 8 in.; length of horns, 11 in.

Habitat—Bushy plains of the Anseba, Bogosland (Hengl.), South Senaar (Casanova).

Shot in Somali Land by T. W. H. Clarke, 1891.

CLARKE'S GAZELLE (*Ammodorcas clarkei*).

[OLDFIELD THOMAS, P.Z.S. 1891, p. 206.]

THIS most remarkable animal combines the horns of a Reed-buck (*Cervicapra*), with the essential characters of a Gazelle, showing a

When I received Mr. Clarke's specimens and examined this particular Gazelle, it was at once apparent to me that it was a new variety—a fact that I had the pleasure to convey to Mr. Clarke.—R. W.

special relationship to that most aberrant Gazelle the Gerenook (*Lithocranius walleri*), and appears certainly to be worthy of generic distinction. On the first arrival of the specimens, before the skulls were cleaned, and before Mr. Sclater had received from Mr. Swayne the face-skins mentioned below, the animal was naturally supposed to be a Reed-buck from the character of its horns, little likely as it appeared that a Reed-buck would occur in the dry sandy plateau of Somali Land. Now, however, that better material is available, I am able to draw up a fairly complete account of the more essential characters of this most beautiful Gazelle, of the discovery of which Mr. Clarke, both as a sportsman and naturalist, has so much reason to be proud.

Muzzle, character of face-marking, and presence of anteorbital glands as in *Gazella*; general form (as described by Mr. Clarke, see below) and skull more as in *Lithocranius*; horns in curve and general appearance as in *Cervicapra*.

Coloration of face, using Sir Victor Brooke's phraseology, as follows:—Central facial band deep rich chestnut-rufous, becoming duller towards the bases of the horns; light facial streaks pure white, very prominent and sharply defined, extending the whole length of the head from the bases of the ears to the corners of the nostrils, somewhat duller and more indistinct at their extremities, but broadening in the middle to encircle the eyes; dark facial streak present, but not strongly marked; cheeks and sides of neck pale fawn; throat white; crown between and behind horns brown or grizzled fawn, the latter condition occurring in the older of Mr. Swayne's two head-skins; a marked whorl of hairs situated between the ears; back of ears short-haired, dark fawn basally, gradually darkening to black terminally; insides white-haired, but with black tips.

Horns evenly curved upwards and forwards, the basal halves running backwards and the terminal halves nearly vertically upwards, the main curvature being therefore exactly in the opposite direction to that found in *Gazella* and *Lithocranius*. The horns themselves slender, their smooth unridged portion very long, the first indistinct ridge occurring about five inches from the tip. Ridges widely separate, strongly defined anteriorly, but becoming abruptly obsolete about half-way round, the sides and back showing scarcely a trace of them;

their number amounting to 10 in the oldest specimen available—a number probably but seldom much exceeded.

Skull diverging from that of *Gazella* and approaching that of *Lithocranius* by being unusually low, long in the occipital region with a comparatively straight cranio-facial angle with very small bullæ with the postero-internal wall of the suborbital fossæ imperfect, and with a remarkably small and slender lower jaw. On the other hand, it differs from the same skull by being peculiar to a less extent in all these points by the greater development of the premaxillæ posteriorly, where they have a broad articulation with the nasals, by the larger nasals and smaller interparietal, and by the larger and more powerful teeth, which are absolutely larger in the smaller animal.

In its skull characters, therefore, *Ammodorcas* stands just intermediate between *Gazella* and *Lithocranius*; in its muzzle and in the characters of its markings it agrees fairly with both, but in general form with the latter only, that animal, like it, being peculiar for its extraordinarily long neck, and finally, in the curvature of its horns it differs absolutely from both, as also from any of the other *Gazelline* genera, while it agrees with a group so different from it in all essential respects that the resemblance must evidently be an accidental one and not indicative of any relationship. Presumably the whole of the horn of this species is homologous with the terminal three or four inches of the *Gerenuk's* horns, that is to say, with the upwardly curved part—the greater part of the horn having become obsolete while the upwardly curved tips have attained to a remarkable proportionate development.

The following are the dimensions of the skull of specimen:—

Length, occiput to gnathion, 210 millim., tip of nasals to occiput 176, greatest breadth 95; height, crown to angle of lower jaw, 94; nasals, length 67, breadth 26; interparietal, length 24, breadth 39; height of orbital opening 35, gnathion to front of anterior premolar 63; length of molar series 53; lower jaw, condyle to front of symphysis 153; height from coronoid process to angle 70; height of ramus at centre of m. 15.4, at posterior end of symphysis 9.

In a letter addressed by Mr. Clarke to Mr. Rowland Ward, the following notes on the appearance and habits of this species are

given:—"The Somali name for these antelopes is 'Debo Tag.' I shot them in the new country I went into, and did not see them in any other part. They have a very thin long tail, and when they run, throw it up and over towards the neck. The neck is very long and thrown back towards the tail, so that the two look as if they would touch each other."

Shortly after the arrival of Mr. Clarke's specimens, Mr. Sclater received from Mr. Swayne two scalps of this species which he had bought in Berbera, and these scalps Mr. Sclater has most kindly handed over to me for the purposes of the present paper. Fortunately, the muzzle of one of them has been preserved, so that I have been able to make out its strictly Gazelline character, and the description of the colours above given has also been taken from these specimens.

It is much to be hoped that more specimens of this beautiful Gazelle will soon be obtained, and that we may thereby gain a full knowledge of its range, habits, and natural affinities.

P.S. (May 14th).—Mr. Clarke has favoured me with the following notes on this new Gazelle:—

"I saw this Gazelle for the first time on December 17th, 1890, about three hours from Bairwell, or about one day from Buroa Well, Habbergerhagi's country, and afterwards on the road all the way into the Marchan district, 8° N. 47° E. I killed a male, and found one of the horns broken off close to the skull, which had apparently been done a year or so ago.

"They are very graceful animals, with a long neck and well-proportioned head and horns; the body is rather slender, but considerably larger than in *Gazella spekii*, about the size of a female *G. walleri*. The legs are long and slender; the hoofs are not so triangular as those of *G. spekii*, and small for the size of the animal."

Mr. Clarke informs me that the female of *Ammodorcas* is without horns, a character which allies it still more closely with *Lithocranius*, and removes it from the typical Gazelles. The exact locality at which he obtained the specimens is about a day and a half from the Buroa Wells, Central Somali, about 100 miles south of Berbera.

BEATRIX ANTELOPE (*Oryx beatrix*).

[DR. J. E. GRAY, P.Z.S. 1857, p. 157.]

THE horns slender, straight, or only very slightly curved near the tip; White, a spot on the middle of the face, a smaller spot between the base of the horns, a large patch on each cheek, extending above up to the eyes, and united together beneath under the throat; the knees and front of the fore and hind legs, and a large spot on the chest, dark blackish brown; the legs to the posterior grey-brown; end of the tail black.

This specimen is not half the size of the Gemsbok from the Cape, and is immediately known from it by the distribution of its colours.

In form and size it resembles the true *Oryx* (*O. leucoryx*), but it differs in the straightness of the horn, the size and form of the cheek-spots, and especially in the dark colour of the legs, and the well-marked white ring around the fetlock joint, just above the hoof.

The hair is whorled on the middle of the haunches like the rest of the genus, and the hairs of the back in front of the withers are directed forwards.

Habitat—Head of Persian Gulf.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
♀ 15	3 $\frac{3}{8}$	4 $\frac{1}{2}$	Head of Persian Gulf.	B. T. Finch, British Museum.

**NILGHAI** (*Boselaphus tragocamelus*).

[From "The Mammals of India," by T. C. Jerdon.]

MALE of an iron-grey colour; lips, chin, lower surface of the tail, stripes inside the ears, rings on the fetlocks and abdomen white; head and limbs tinged with sepia-brown; mane, throat-tuft, and tip of tail, black.

The female is a good deal smaller than the male and tawny or light brown.

Length of male about $6\frac{1}{2}$ to 7 feet; height at shoulder 4 feet 4 inches to $4\frac{1}{2}$ feet; horns 8 to 9 inches, rarely 10; ear 7 inches, very broad; tail 18 to 21 inches.

Habitat—India.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.

INYALA (*Tragelaphus angasi*).

[G. F. ANGAS, P.Z.S. 1848, p. 89.]

THIS brilliant Antelope, the Inyala of the Amazulu, appears to be a link between the Koodos and Boshbok, uniting in itself the markings and characteristic features of both these animals. The adult male is about 7 ft. 6 in. in total length, and 3 ft. 4 in. high at the shoulder. Though elegant in form, and much of the grace of the solitary Koodos, the robust and shaggy aspect of the male bears considerable resemblance to that of the Goat. Legs clean; hoofs pointed and black, with two oval cream-coloured spots in front of each fetlock, immediately above the hoof; horns 1 ft. 10 in. long, twisted and sublyrate, very similar to those of the Boshbok, but rather more spiral; have polished extremities of a pale straw colour; rest of horns brownish-black, deeply ridged from the forehead to about half the length of the horn; prevailing colour greyish-black, tinged with purplish-brown and ochre; on the neck, flanks, and cheeks, marked with several white stripes like the Koodos; forehead brilliant sienna-brown, almost approaching to orange; mane black down the back and white from the withers to the insertion of the tail; ears 8 in. long, oval, rufous, tipped with black and fringed inside with white hairs; a pale ochreous circle round the eyes, which are connected by two white spots forming an arrow-shaped mark on a black ground; nose black; a white spot on each side of the upper lip; chin and gullet white; and three white marks under each eye; neck covered with long shaggy hair, extending also under the belly and fringing the haunches to the knees; two white spots on the flanks, and a patch of long white hair on the anterior portion of the thigh; a white tuft under the belly and another on the dewlap; on the outer side of the fore-legs is a black patch above the knee surrounded by three white spots; legs below the knee bright rufous colour; tail 1 ft. 8 in. long, black above, with tip and inside white.

Female smaller and without horns.

The young resembles the female, but is rather paler in colour, and has more white spots on the flanks and sides.

Inhabits the lower undulating hills, scattered with Mimosa bushes, that border upon the northern shores of St. Lucia Bay, in the Zulu country, lat. 28° south. Found in small troops of eight or ten together, feeding amongst the thickets.

INYALA (*Tragelaphus angasi*)—continued.*Habitat*—South-East Africa and Zulu Country.

ARABIAN IBEX (*Capra sinaitica*).

[Rev. H. B. TRISTRAM on the Mammals of Palestine, P.Z.S., 1866, p. 85.]

THE Syrian Ibex, or Bedeb of the Arabs. Only found in Palestine in the neighbourhood of the Dead Sea, especially about Engedi. Very abundant on the east side in the mountains of Moab, and still more so throughout the Sinaitic peninsula. It formerly extended to the Lebanon, where its teeth have been found in cave-breccia by ourselves and by M. Lartet. (See Bull, *Sve. Geol. de France*, 22, p. 543.) Quite as wild, nimble and wary as the Ibex of the Alps. It drops its kid in March or April, and has but one at a birth. Several young ones were brought to us and reared for some time by hand. The horns of the female are much smaller than those of the male. The flesh is excellent, far superior to that of the Gazelle. The horns are subquadrangular, sharply emarginated at the inner anterior angle, and with from twenty to twenty-four (in fully adult specimens) bold ridges on the front face only.

Habitat—Upper Egypt, Sinaitic Peninsula and Palestine.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
38 $\frac{7}{8}$	7 $\frac{1}{2}$	12 $\frac{1}{4}$	Upper Egypt, Sinaitic Peninsula & Palestine.	Sir Edmund G. Loder, Bart.

MARCO POLO'S SHEEP (*Ovis poli*).

[Sir VICTOR BROOKE, Bart., and Mr. BASIL BROOKE, P.Z.S. 1875, p. 514.]

THE horns are very large, pressed in from the sides, the edges, with the exception of the fronto-nuchal edge, being rounded. The orbital surface is pressed in, and commences to get narrower only during the last third of its length. The horn is more than four times the length of the skull. The basal and terminal axes of the horns are not parallel, the latter being directed more horizontally. All round the neck there is a pure white mane, and there is a dark line along the spiral column from the shoulders to the loins. The light greyish brown of the sides shades off into white towards the belly. A pure white anal disk surrounds the tail; above this disk is bordered by a rather dark line, but below it extends largely over the hinder parts of the thighs, shading gradually into the brown colour of the legs. I did not discover any soft short hair under the long winter hair during the month of October.

Height, 46 inches; length of horns, 57 inches.

Habitat—Central Asia, the Pamir, and Thian Shan of Turkestan.

Length.	Circumference.	Tip to Tip.	Habitat.	Owner.
75	16	54½	H.E. Gen. Sir Fredk. Roberts, "The Asian," Nov. 13th, 1891.

WILD SHEEP OF THIAN SHAN (*Ovis karelini*).

[Sir VICTOR BROOKE, Bart., and Mr. B. BROOKE, P.Z.S. 1875, p. 512.]

THE horns are moderately thick, with rather rounded edges; frontal surface very prominent; orbital surface rather flat, narrowing only in the last third of its length. The horns are three times as long as the skull. The basal and terminal axes of the horn rise parallel with each other; the median axis is parallel with the axis of the skull. The neck is covered by a white mane, shaded with greyish brown. The light brown of the back and sides is separated from the yellowish white of the belly by a wide dark line. The light brown of the upper parts gets gradually lighter towards the tail, where it becomes greyish white, but does not form a sharply marked anal disk. On the back there is a sharply marked dark line running from the shoulders to the loins. I did not find any soft hair under the long winter hair in October.

Height at the shoulder, 3 ft. 6 in. ; length of the horns, from 44 in. to 45 in.

Range.—*Ovis karelini* inhabits all the Semiretchinsk Altai, and also the Sapliskey Altai, but is not so common there as in the mountains between Tamgali (?) and Kaskelen; but it is partly driven from this latter locality by the Cossack sportsmen, and has gone to a higher elevation, namely the Kebin Steppe, above the range of trees. East of Tamgali (?) (Turgeli) (?), on the bare mountains and plains near the rivers Chilik and Kelen, *Ovis karelini* is very abundant, but not on the mountains covered with trees; it extends from this locality as far as Santash. Further it inhabits all the neighbourhood of Issik Kul; is rather rare on the northern parts of the Thian Shan, which are thickly wooded. I also met with numerous flocks in the steppes of the Narin, where they find abundance of food and shelter at an elevation of about 12,000 or 13,000 feet above the level of the sea.

This species is also met with on the mountains separating the Narin from its tributary the Atpash, as far as the plains between the rivers Kurtka and Chatir Kul ; but from the eastern sources of the Atpash as far as the Chatir Kul it is found only in company with *Ovis polii*.

OVIS HODGSONI.

[Sir VICTOR BROOKE, Bart., and Mr. B. BROOKE, P.Z.S. 1875, p. 520].

ADULT male, winter, Colebrooke collection. Obtained within 30 miles of Leh in the winter of 1873.

Hair of body about 2 inches in length, coarse and close-set; on the sides and lower surface of the neck the hair is lengthened into a long rich ruff-like mane of a snow-white colour. Along the median line of the upper neck there is a narrow band of rather shorter hair, which, however, is about twice as long as that on the body, and, being continued as far back as the withers, forms a short dorsal mane; general colour of the body dark brown, mixed with grey; anterior parts of the face, belly, limbs below the carpi and tarsi internally, and a small anal disk surrounding the tail and rump, dirty white; cheeks and forearms darker than the rest of the body; ears and tail short, the latter with a narrow dark line along its upper surface; horns massive and rather short, their terminal curve being but slightly developed.

Female, much paler than the male, with little or no mane. No distinct anal disk.

Range.—Little Thibet (Kinloch, &c.); Cachar region, Nepal (Hodgson).

Habitat—Nepal.

OVIS BROOKEI.

[Sir VICTOR BROOKE, Bart., and Mr. B. BROOKE, P.Z.S. 1875, p. 521].

THIS species is based upon a skull and horns in our own collection. The locality from which the specimen was obtained is not so certain as could be desired, but we have strong reasons for believing that the animal was shot in the vicinity of Leh, in Ladak. In its much smaller size it differs from *Ovis hodgsoni*, and in its deeply sulcated horns, the angles of which are very much rounded and the terminal curve but slightly developed, it differs as decidedly from *Ovis karelini*. It is not improbable that the species will be found to inhabit the Kuenlun Mountains.

Habitat—Ladak.

Dimensions of the specimen :

	inches.
Length of skull, measured from highest point between the horn	11

KAMSCHATKA WILD SHEEP or WILD SHEEP OF ALASKA
(*Ovis nivicola*).

[Sir VICTOR BROOKE, Bart., and Mr. B. BROOKE, P.Z.S. 1875, p. 521.]

ADULT male (winter), Mus. Lugd., Kamschatka.

Hair very long and woolly, and not lengthened into a mane on the neck; general colour grizzly brown; an indefinitely bounded patch on the face below the eyes, and all four limbs anteriorly rich uniform dark brown; space round the muzzle, upper and under lip, rump, and posterior part of the haunches, centre of the belly, and the limbs posteriorly pure white. The white on the posterior parts of the limbs give place very suddenly to the brown of their anterior surfaces. The white of the rump does not surround the tail, which on its upper surface is darker than the back. Ears and tail very short.

Horns in form closely resembling those of *Ovis montana*. Frontal and nuchal surfaces convex; orbital surface flat; fronto-nuchal and edges very greatly rounded; fronto-orbital edge strongly defined, a deep groove lying between it and the orbital surface; the terminal curve of the horns well developed, and directed upwards and outwards.

Skull remarkably short and broad, and strongly ankylosed; a shallow anteorbital fossa. Length from between horns to end of præmaxillæ 10 inches, its greatest width across the orbits $6\frac{3}{4}$ inches; height at the shoulder, 37 inches; length of horns round curve, 33 inches, their circumference $12\frac{3}{4}$ inches.

Adult male, Mus. Strassburg. Only differs from the former in being considerably paler in colour. Length of horns 27 inches, their circumference $13\frac{1}{2}$ inches.

Adult female, Mus. Lugd. Is darker than the male, and has short compressed horns, about 9 inches in length. The distribution of colour is the same as in the male.

Range.—Kamschatka (Eschscholtz); Stanovoi Mountains, as far south as the sources of the Utschur (Middendorff).

Habitat.—Kamschatka.

MOUFFLON (*Ovis musimon*)*

[BLYTH, P.Z.S. 1840, p. 72.]

It is unnecessary to give a detailed description of this beautiful little species, though I may mention that the fine living male in the gardens measures 39 in. from nose to tail, the tail 5 in.; from nose to base of horn 7 in.; ears 4 in.; neck, from posterior base of horn to the abrupt angle of its insertion, 8 in., and thence to base of tail 21 in.; height at the shoulder $2\frac{1}{4}$ ft.

The female has seldom any horns, which, when they exist, are ordinarily about 2 in. long.

AOUDAD (*Ovis tragelaphus*).

[BLYTH, P.Z.S. 1840, p. 75.]

THIS animal appears to vary considerably in size—some exceeding a Fallow Deer in stature, while others are much smaller. It has no beard on the chin, like the true goats, but is remarkable for the long hanging hair in front of the neck and on the upper part of the fore-limbs, the former attaining in fine males to about a foot in length, and the latter to 9 in.; there is also some lengthened hair at the setting on of the head, and a dense nuchal mane, the hairs of which are 3 in. long, continued over the withers till lost about the middle of the back; general colour yellow-brown; horns moderately stout, turning outwards, backwards, and so inwards, with the tips inclining towards each other.

This species is well known as the "Aoudad" of the Moors, and the "Kebsh" of the Egyptians; it is also, according to Rüppell, the "Tedal" of the inhabitants of Nubia, which is doubtless the same as "Teybal," applied by Burkhardt to the wild goat of that region, in addition to the word "Beden," which (in common with Rüppell and others) he also assigns to the latter.

DWARF BUFFALO (*Bos pumillus*).

[Sir VICTOR BROOKE, Bart., P.Z.S. 1875, p. 455.]

FEMALE about three years of age, all the permanent incisors except the two external teeth being in place (Zoological Gardens, Antwerp, received from Senegal) :—

Hair harsh, on the body and limbs of moderate length, longer on the withers and upper and under parts of the neck ; general colour bright yellow ; on the shoulders and anterior parts of the body there is a strong tinge of brown, caused by an intermixture of brown and yellow hairs ; on the flanks and belly the yellow shades gradually into deep rufous ; upper parts and sides of the head and neck pure yellow, lower surface of head and neck paler ; entire upper and lower lip, fore limbs from above the carpi, and hind limbs from below the tarsi downwards black ; ears about 10 in. in length and 6 in. in breadth, narrowed gradually towards their tips, which, from their flexibility and length, curl back upon the ear-conches ; internally the upper rim of the ear-conch is covered by pure yellow hair of about 5 in. length, hair of similar length and colour forming two marked lines along their inner surface ; hair on the lower rim of the ear-conch and on the tip black ; tail bare, excepting the terminal tuft, which is black.

Height at the shoulder about 42 in.; horns slightly compressed at their bases, and directed upwards; the head is remarkably long in proportion to the body, which is compact and powerful, the limbs short.

MALE, ADULT.—Generally darker than the female (Du Chaillu); horns greatly compressed from above downwards and broad at their bases, which are transversed in unworn specimens by numerous sharply-marked irregular ridges; beyond these ridges the horns are suddenly contracted into round smooth points, which are directed upwards and sometimes boldly backwards.

The basal portion of the horn in most *adult* specimens rises slightly but decidedly from the horizontal upon leaving the skull; in other specimens, however, as for example in the type, the entire horn is directed upwards; length of horns round the curve about 21 in., their diameter at the base 7 in.

FEMALE, ADULT.—In the female the horns are much less compressed at the base than in the male; as in the male the direction of the points of the horns is very variable; length of horns round the curve 17 in., their diameter at the base $4\frac{1}{4}$ in.

RANGE.—Western Equatorial, and the northern parts of Central Africa.

Omar ...	6 2	7 0	3	2	3	6	1 7 1 5	1 15 1 21		

Height of African Elephant, foot to shoulder, 10 ft.; F. C. Selous,
 "A Hunter's Wanderings."

Dimensions of Male Elephant killed on Lake Nyassa, 9th September,
 1861 (Dr. Kirk, P.Z.S. 1864, p. 655).

	ft.	in.		ft.	in.
Height at withers	10	3	Horizontal diameter of ear ...	3	0
Circumference of fore foot	5	1	Perpendicular do. ...	5	9
From tip of trunk to crown of head	9	0	Semicircumference of belly ...	9	0
Crown of head to insertion of tail ...	12	0	Do. of chest ...	7	10
Length of tail	4	2	Each tusk weighed about 30 lbs.		

Dimensions of Elephant brought from South Africa by
 H.R.H. the Duke of Edinburgh.

	ft.	in.		ft.	in.
Height at withers	10	0	Circumference of head	10	0
From tip of trunk to tip of tail ...	23	5	From ear to ear	9	0
Girth	16	6	Length of ear	4	6
From top of head to end of trunk ...	11	3	The skull and tusks weighed more than 3 cwt. ; the weight of the whole skin when taken from pickle 20 cwt. 6 lbs.		
The weight of the entire elephant in the flesh was 4 tons 8 cwt. 4 lbs.					

Weight of a Baby Elephant, when born, about 213 lbs.

Period of gestation, 629 days.

TOOK BY G. V. H. BROWN, FIELD

AFRICAN ELEPHANT

ELEPHAS AFRICANUS

THIS formed part of the Trophy of His Highness the Maharajah of Kuch Behar exhibited at the Indian and Colonial Exhibition, 1886.

STATISTICS OF GREAT GAME SHOOTING.

ROWLAND WARD'S BOOK OF
HORN MEASUREMENTS, WEIGHT, LENGTH, &c.,
OF THE
GREAT GAME OF THE WORLD:
BEING A RECORD FOR THE USE OF
SPORTSMEN AND NATURALISTS.

BY ROWLAND WARD, F.Z.S.,
Author of "The Sportsman's Handbook," &c.

LONDON: OF THE AUTHOR, 166, PICCADILLY.
One Vol., 4to., Cloth, Special Price, 21/- By Post, 21/6.

ROWLAND WARD & Co., LIMITED,
NATURALISTS TO THE COURT,

By Special Appointment to His Royal Highness the Prince of Wales, His Royal Highness the Duke of Edinburgh, and the Courts of Europe,

"THE JUNGLE," 166, PICCADILLY, LONDON, W.

TELEPHONE—3644.

Practical and Artistic Taxidermists, Designers of Trophies of Natural History, Preservers and Adapters of all Specimens of Animal Life. Natural Features of Animals adapted in Original Designs for Decorative Purposes and Every-day Uses. Furriers and Plumassiers, and Collectors in Natural History.

NOTICE.—ROWLAND WARD, F.Z.S., is the only member left in the profession of the Ward Family, long unrivalled for their accumulated experience and their skill in Practical Taxidermy, especially in its artistic department.

Medals and Diplomas of Honour for Artistic Work:

London International Exhibition, 1862.

Paris International Exhibition, 1862.

Vienna International Exhibition, 1873.

London International Fisheries, 1883.

Calcutta International Exhibition, 1883-84.

London International Health Exhibition, 1884.

London Colonial and Indian Exhibition, 1886.

The Anglo-Danish Exhibition, South Kensington, 1888.

The Royal Military Exhibition (Army Medical Department), 1890.

At the Calcutta International Exhibition, 1883-84, a Gold Medal and First Class Certificate were awarded to ARTHUR CRAWFORD, Esq., Bombay Civil Service, for a Collection of the Birds of Western India that were Preserved and Mounted in original design by ROWLAND WARD, F.Z.S.

THE COLONIAL AND INDIAN EXHIBITION.

THE JUNGLE.

"But everything else here is likely to be forgotten in presence of the wonderful jungle scene which Mr. Rowland Ward has constructed. . . . This will certainly be the first of the many attractions to which visitors will turn.

. . . They will find themselves in presence of a scene which is likely to keep their gaze for some time. Mr. Ward has made the most of his limited space, into which he has collected the scenery and life which, in reality, is found scattered over an area of many thousand square miles. On the right we have a trophy from Kooch Behar, formed by His Highness the Maharajah, the most prominent feature of which is a tiger hunt. We see a great group in the deep grass jungle. . . . Adjoining this are trophies designed to represent generally the Fauna and Flora of India, by representative animals and birds, picturesquely grouped in illustration of their life-habits."—*Times*.

"The visitors . . . were lost in admiration of Mr. Rowland Ward's masterly designs, modellings, and general arrangement. The novelty is already known as 'the Jungle.' . . . The deep grass jungle is occupied necessarily by many creatures which would not in their native wilds be found in such close companionship. . . . The scene is rendered with true tragic power."—*Daily News*.

"These numerous beasts . . . seem to illustrate the Fauna of India in a most vivid manner, and are very artistically prepared and arranged. . . . The entire trophy has been prepared by Mr. Rowland Ward. This group will unquestionably be one of the leading attractions of an exhibition which is already full of marvellous things."—*Morning Post*.

"Fitted up with the most perfect completeness—a jungle—the work of Mr. Rowland Ward. . . . The whole scene depicted is so life-like that one is startled by its vivid realism. . . . This jungle alone is almost enough to make an exhibition. . . . Besides, Mr. Rowland Ward has designed and arranged such other scenes in connection with several Colonial Courts."—*Daily Chronicle*.

"Mr. Rowland Ward, of Piccadilly, provides what will probably prove the most attractive feature of the exhibition, in the form of a series of picturesque trophies representing India, Ceylon, South Africa, Canada, and Queensland."—*Sportsman*.

"Perhaps the first place must be accorded to the jungle scene of Mr. Rowland Ward, which stands at the head of the Indian Courts, and which will certainly prove one of the favourite sights of the vast show."—*Daily Telegraph*.

THE SPORTSMAN'S HANDBOOK.

"Sport, however, it must be borne in mind, is a thing of every climate and of all seasons, and the manual referred to—'The Sportsman's Handbook,' by Rowland Ward, F.Z.S.—has a little to say of most regions, from the North of Scandinavia to the South of India. All knowledge is apt to come in useful; and even those of us who may never know the delight of facing a charge of the Cape buffalo—under some circumstances among the most dangerous experiences of the sportsman, we are told—may yet find a less rapturous pleasure in learning how a real sportsman should entertain such a visitor. The next best thing to being able to shoot a lion in a workmanlike fashion is to know how the thing ought to be done, and that is among the items of instruction in this little book."—*Daily News*, *Leading Article*.

"With this in his portmanteau, no one fond of shooting and collecting need any longer lament his inability to preserve his trophies, since the directions given for skinning and preserving animals of all kinds are extremely clear and simple, and rendered all the more intelligible by the wood engravings by which they are accompanied. Quadrupeds, birds, fishes, reptiles, and insects, are all dealt with in turns, and directions given not merely for skinning them, but also for mounting them, if desired, a year or two (it may be) after they have been procured."—*Field*.

"No one has a better right to speak with authority on questions of taxidermy than Mr. Ward, whose skill in the art is well known to everyone interested in the subject. In an introductory chapter he deals with much practical wisdom with the general equipment of a sportsman bent on big game, and gives some valuable particulars as to the places in which in various animals a well-aimed shot will be fatal. . . . The middle of the book is occupied with directions as close and full as possible as to the skinning and preparation of various creatures; and, as we have said, no one is better qualified than Mr. Ward to give such directions. After this comes a synoptical guide to the Hunting Grounds of the World. A special feature in the arrangement of the book is found in the reservation of several blank pages at the end for memoranda."—*Saturday Review*.

"Mr. Ward's eminently clear and practical directions and hints come to us particularly well-timed. . . . It is a thoroughly working little volume, and no sporting collector ought to be without it."—*Land and Water*.

"A valuable feature of this book is the directions (with anatomical diagrams) given for vital shots at great and dangerous game. This is original information, and so is the important division of the work that treats of the hunting fields of the world, and what *Jeva natura* can be met with by the sportsman in each locality. . . . The book is a valuable and well-written contribution to the literature of the subject of which it treats, and it will be welcomed by the gentleman sportsman, for whom it has been prepared, quite as much as by the aspirant in the arts of taxidermy, to whom some of its pages will convey a sort of revelation."—*Country Gentleman*.

"The text is made as clear as possible, but wherever the explanation can be assisted by an illustration one is introduced."—*Daily Chronicle*.

"The name of Ward, father and sons, has acquired a world-wide reputation. . . . To sportsmen in India this book should prove specially attractive and useful; it should certainly be in the possession of every sportsman and collector."—*Calcutta Englishman*.

"The traveller and the trader will find it a useful companion."—*Cape Argus*.

1 Vol., Crown 8vo. Sixth Edition, with numerous additional illustrations. Bound in Crocodile Leather. Price 3s. 6d. By Post, 3s. 9d.
